

CAREER OBJECTIVE

Seeking a Full-Stack Developer position with a strong backend focus at a fast-growing product company where I can take ownership of features and deliver real customer value. I aim to leverage my five years of experience in C# / .NET (ASP.NET MVC, .NET Core, Web API, Entity Framework), SQL Server, and microservices architecture, together with backend work in Python and front-end development in JavaScript and React, to build high-quality, maintainable, and well-tested applications. I am especially passionate about AI and Agentic development — I actively build and orchestrate AI agents and agentic workflows to automate engineering tasks — and I am eager to apply these skills in an AI-first product environment.

PROFILE SUMMARY

I have five years of experience as a full-stack developer with a strong focus on backend technologies — C# / .NET (ASP.NET MVC, .NET Core, Web API), Entity Framework, SQL Server, and microservices architecture — complemented by Python backend development and front-end development using JavaScript, TypeScript, and React. I build high-quality, readable, and testable code across both backend and frontend, and I have hands-on experience with unit and integration testing, RESTful API development, and event-driven and dependency-injection-based designs. I work with Agile methodologies and version control tools such as Git and Jira. I am deeply invested in AI-powered and Agentic development: beyond using tools like Claude, GitHub Copilot, and Cursor to boost productivity and code quality, I have hands-on experience building and customising my own Claude Code skills (SKILL.md), agents and subagents, and MCP (Model Context Protocol) servers, and experimenting with multi-agent orchestration (Coder, Reviewer, Test Generator, and QA agents) to automate and accelerate my engineering workflow. I have a product mindset, strong problem-solving and R&D skills, and I adapt quickly to new technologies.

SKILLS

- Languages & Frameworks:** C#, .NET 8, .NET 6, .NET Core 3.1, .NET Framework 4.x, ASP.NET Core, ASP.NET MVC, Web API, Entity Framework Core, RESTful API, Python, JavaScript, TypeScript, ReactJS, Redux, HTML, CSS, Java.
- AI & Agentic Development:** Claude (Anthropic), GitHub Copilot, Cursor, Claude Code (custom skills via SKILL.md, agents/subagents), MCP (Model Context Protocol) servers, multi-agent orchestration pipelines (Coder / Reviewer / Test Generator / QA agents) for automating engineering tasks.
- Architecture & Patterns:** Microservice Architecture, Event-driven architecture, Clean Architecture, CQRS, Mediator Pattern, Dependency Injection (DI), Repository & Service Pattern, SOLID, DRY, OOP, Design Patterns.
- Databases:** Microsoft SQL Server, Azure SQL, PostgreSQL, Redis (relational and document/key-value stores).
- Testing:** Unit Testing and Integration Testing (Moq), test-driven and maintainable code practices.
- DevOps & Tools:** Git, Jira, Azure DevOps (Pipelines, CI/CD), Docker, Kubernetes, Visual Studio, Agile/Scrum.
- Azure Cloud Platform:** Azure Functions, Azure Service Bus, Azure Event Hubs, Azure SQL, Azure Storage, App Service, Application Insights, Azure Synapse.
- Languages:** English – Upper-Intermediate (B2).

CERTIFICATES

- Microsoft Certified: Azure Fundamentals (AZ-900).
- Developing Solutions for Microsoft Azure (AZ-204)
- Microsoft Certified: Azure Data Fundamentals (DP-900)
- Cloud Developer using Microsoft Azure (Udacity Nanodegree Program)

| Developer (back-end developer)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                     |
| <ul style="list-style-type: none"><li><b>Description:</b> Contributed to the open-source dotnet/msbuild project as part of Beyondsoft's role as a Microsoft Partner, focusing on enhancing the MSBuild build system for .NET applications. The work involved optimising build processes, improving error handling, and enhancing performance and reliability for large-scale projects. Efforts also included resolving issues related to SDK references, distributed logging, and assembly attribute handling to improve build reliability and developer experience.</li><li><b>Responsibilities:</b><ul style="list-style-type: none"><li>Adopted AI-powered development tools (Claude, GitHub Copilot) in my personal workflow to accelerate code review, generate boilerplate code, draft technical documentation, and explore solutions for complex build-system issues — significantly improving my own productivity, code quality, and delivery speed.</li><li>On my own initiative, built and customised personal Claude Code skills (SKILL.md), agents/subagents, and MCP (Model Context Protocol) servers to automate recurring coding and code-review tasks in my day-to-day work, and self-studied multi-agent orchestration (Coder, Reviewer, Test Generator, and QA agents) to speed up my engineering workflow.</li><li>Collaborated on pull requests (https://github.com/dotnet/msbuild/pulls/huulinhnghuyen-dev) to improve the MSBuild project, and wrote unit tests to validate changes.</li><li>Performed routine maintenance tasks, including reviewing pull requests to ensure code quality and consistency, and monitoring internal Azure DevOps build pipelines (CI/CD) to verify successful execution and troubleshoot failures.</li><li>Addressed user-feedback tickets on the Visual Studio Community platform tagged with MSBuild, investigating and resolving issues related to build errors, SDK configurations, and toolset compatibility to improve user experience and system reliability.</li><li><b>Technologies Used:</b> C#, .NET, MSBuild, Roslyn, Azure DevOps, Git, GitHub Copilot, Claude, Claude Code (SKILL.md, agents/subagents), MCP servers.</li></ul></li></ul> |                     |

| Developer (full-stack developer)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                     |
| <ul style="list-style-type: none"><li><b>Description:</b> Working as a full-stack developer on an audit system built with an event-driven microservice architecture. The client is one of the Big 4 of the audit industry.</li><li><b>Responsibilities:</b><ul style="list-style-type: none"><li>Built RESTful APIs in C# / ASP.NET Core as the integration layer between the portal and backend services, retrieving and processing data from SQL databases using Entity Framework Core and applying dependency injection (DI) throughout.</li><li>Designed and built service-to-service integration connecting Azure Functions, Azure Service Bus, and Azure Event Hubs into a reliable event-driven flow so data could move automatically between microservices.</li><li>Integrated event producers and consumers: events triggered functions that processed the data and pushed it to downstream services and to SQL via Entity Framework Core, with retry and error handling to ensure no events were lost.</li><li>Developed the portal website UI using ReactJS and TypeScript, delivering maintainable and testable frontend features.</li><li>Wrote unit tests for each implemented function using Moq, and monitored the integration flow with Application Insights to quickly find and fix failures in the pipeline.</li><li>Integrated Azure Synapse into the data flow for big-data analysis on the processed audit data.</li><li>Reviewed and supported team members within an Agile team.</li><li><b>Technologies Used:</b> C#, .NET 6, ASP.NET Core, ASP.NET MVC, Entity Framework Core (Code First), RESTful API, SQL Server, Azure Functions, Azure Service Bus, Azure Event Hubs, Azure Synapse, Application Insights, Azure DevOps, ReactJS, TypeScript, Redux, Redis, CI/CD, Dependency Injection (DI).</li></ul></li></ul>                                                                                                                                                                                                                                                                                                                                                              |                     |
| Developer (back-end developer)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | May 2024 – Oct 2024 |
| <ul style="list-style-type: none"><li><b>Description:</b> An open, decentralised platform for data exchange between nodes following Web 3.0 principles. The backend was built in Python using a microservice approach with Clean Architecture, providing the integration layer between the application and the decentralised blockchain platform where multiple nodes interact, each controlled by different stakeholders.</li><li><b>Responsibilities:</b><ul style="list-style-type: none"><li>Built the Python backend services that integrate with the decentralised blockchain platform, organising the code with Clean Architecture (separating domain, application, and infrastructure layers) to keep the integration logic maintainable and testable.</li></ul></li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                     |

- Split responsibilities across small, independent microservices so that data exchange between nodes could be handled and deployed separately, and studied the blockchain platform's core functionalities to ensure correct integration.
- Implemented features supporting transaction processes, including transferring tokens or assets between wallets on the blockchain network, with attention to secure and reliable wallet-to-wallet communication.
- Built a Python CLI and used PostgreSQL for the application's data, adding basic error handling and retries around the blockchain calls.
- **Technologies Used:** Python, PostgreSQL, Python CLI, Microservice Architecture, Clean Architecture, Web3.

#### **Developer (full-stack developer)**

**May 2022 – Apr 2024**

- **Description:** A healthcare-focused data exchange platform that enables data analysts (DAs) to access multiple data nodes using JupyterLab. The blockchain layer ensures secure payment processing and stores essential metadata such as policyid and bucketid. The platform also features a Nectar module that facilitates complex computations.
- **Responsibilities:**
  - Worked in Python across the platform's services to support data exchange between nodes and the computation flow through the Nectar module.
  - Modified and optimised smart contracts written in Solidity to enhance blockchain functionalities related to data exchange and payment processing.
  - Updated and refactored JavaScript code within StarNode to integrate with the Nectar module, enabling seamless computational operations.
  - Contributed to front-end development when necessary, ensuring smooth interaction between the UI and blockchain-based data processing.
  - **Technologies Used:** Python, Solidity, JavaScript, Node.js, JupyterLab, Blockchain, Web3.

#### **FPT SOFTWARE**

**Ho Chi Minh City**

#### **Developer (back-end developer)**

**Mar 2021 – May 2022**

- **Description:** Working as a back-end developer on a work-from-home tracking system using an event-driven CQRS architecture with the Mediator pattern. This system is multi-tenant with a large number of users.
- **Responsibilities:**
  - Built RESTful APIs in C# to get and process data from SQL and Table Storage, using Entity Framework Core and dependency injection (DI).
  - Built service-to-service integration within an event-driven CQRS architecture (Mediator pattern), integrating client telemetry into the system: client events triggered functions that received, processed, and stored the data in SQL and Table Storage via Entity Framework Core.
  - Implemented UI for the portal website using ASP.NET MVC.
  - Used Application Insights to check logs and monitor the telemetry data flow, making sure events from clients were received and processed correctly.
  - Created resources, set up, and executed deployment for each environment via Azure DevOps.
  - Gathered requirements from customers, wrote internal documentation, and reviewed and supported team members.
  - **Technologies Used:** C#, .NET Core, ASP.NET MVC, Entity Framework Core (Database First), RESTful API, SQL Server, Azure Functions, Azure Storage, Application Insights, Azure DevOps, CQRS Pattern, Dependency Injection (DI).

#### **Developer (cloud developer)**

**May 2020 – May 2021**

- **Description:** Working as a cloud developer on a migration project. This system is for a global company operating across many countries that wanted to move their on-premise servers to Azure.
- **Responsibilities:**
  - Researched Azure Migrate to migrate on-premise applications to Azure.
  - Researched virtual networks, subnets, Docker, and Kubernetes.
  - Wrote TAD (Technical Architecture Design) documents for each country.
  - **Technologies Used:** Azure Storage, App Service, Application Insights, Azure Logic Apps, Azure Database for PostgreSQL server, Azure Virtual Machine, Docker, Kubernetes.
